

In summary, to answer “the man’s” question “What do you have to lose?” Here’s a simple graphic to illustrate the common hydroxychloroquine toxicities **in the absence of taking it while seriously ill** for any cockwomblers that believe they understand the peer reviewed scientific literature. Illness and additional medications alone and combined, both increase the risk of these problems.

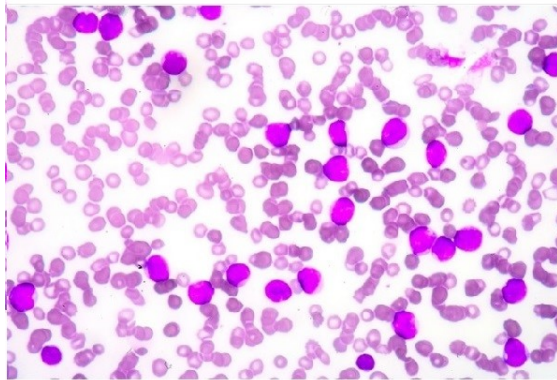

Stevens-Johnson Syndrome

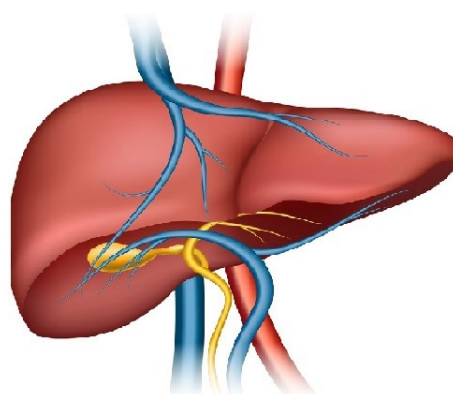

Heart failure, Ventricular Tachycardia

Eyesight (blindness)

Aplastic Anemia
(dangerous blood disorder that can cause death)

Fulminant Hepatitis
(permanent liver damage)

Loss of Life
(from all but blindness above)
